

IN THE ABSTRACT

Please make the following changes to the Abstract:

A latch mechanism ~~having~~has an input member and an output member; ~~the~~The mechanism ~~having~~has a first coupled condition at which the input and output members are coupled such that movement of the input member from its first position to its second position causes movement of the output member from its first position to its second position; ~~the~~The mechanism ~~having~~has a ~~second~~decoupled condition at which the input member is not coupled to the output member; ~~the~~The mechanism further ~~including~~includes a block member, which, with the mechanism in the decoupled ~~its second~~ condition, further prevents at least one of the input and output member from moving to its respective second position.
